
Scale = percent slower per percent of the training curve c(W). Training rows: within runner, ordinary runs (race-distance runs removed), n = 397,682. Platform efforts (20.9 to 21.6 km or 41.7 to 43.4 km at 80%+ HRmax): loss against the fitness prediction, pooled, above 10 C (marathon n = 685, half n = 2,748); finish time on c(W) with runner x distance fixed effects (marathon n = 735, half n = 3,567). Official: repeat-finisher edition effects (321 marathon, 239 half editions). C: 3,433 efforts (80% half), fifths of the held-out multiplier (sensitivity trait, heat-exposure index, volume). 95% CI, clustered by runner.
