
Race-distance efforts of platform runners. A: runner x distance fixed effects with c(W) as covariate, all efforts (n = 4,302, 834 runners). B: pooled OLS on efforts above 10 C, loss on typical cost, typical cost x index and typical cost x volume, without and with level terms for index and volume; correlation of index and typical cost 0.69. C: pooled OLS within WBGT band, loss on index with c(W) and a marathon shift; squares mark the largest reduction a cost-proportional effect could reach at index 1. 95% CI, clustered by runner.
