

Marathon heat-slowdown functional forms: GetFast vs coach vs published fits

All curves = % pace slowdown vs a 10°C anchor; right labels add minutes on a 3:30 marathon. GetFast DL median from the s1_500k checkpoint (822 runners).

Published slopes/equations read from synthesis.tex. Some forms are natively air-temperature (Martin, Vernon), so horizontal placement above ~18°C is approximate: this compares shape and magnitude, not the exact heat metric.
